

Tip - it's JavaScript

There's something you want AndroidScript to do and you can't find out whether AndroidScript can do it.

Maybe you want to find the current time or date but the AndroidScript docs don't mention it.

Remember, you are mostly using JavaScript. If JavaScript can do it, there's a good chance AndroidScript can do it.

The number of times I've typed things like **javascript slice** into google is legion. I often end up at w3schools.com for my answer.

If you look at js sample code, you may need to ignore the bit that tries to display it for you such as

```
document.getElementById("demo").innerHTML = Date();
```

and replace it with something from AndroidScript like

```
txt.SetText( Date() );
```

but you'll find lots of things JavaScript can do that are not specific to AndroidScript.
